

Nonlinear Programming: Theory and Algorithms, 3rd Edition

Mokhtar S. Bazaraa, Hanif D. Sherali, C. M. Shetty

E-Book	ISBN: 978-1-118-62630-6	June 2013	£120.99
Hardcover	ISBN: 978-0-471-48600-8	June 2006	£134.00
O-Book	ISBN: 978-0-471-78777-8	October 2005	Available on Wiley Online Library

DESCRIPTION

COMPREHENSIVE COVERAGE OF NONLINEAR PROGRAMMING THEORY AND ALGORITHMS, THOROUGHLY REVISED AND EXPANDED

Nonlinear Programming: Theory and Algorithms—now in an extensively updated Third Edition—addresses the problem of optimizing an objective function in the presence of equality and inequality constraints. Many realistic problems cannot be adequately represented as a linear program owing to the nature of the nonlinearity of the objective function and/or the nonlinearity of any constraints. The *Third Edition* begins with a general introduction to nonlinear programming with illustrative examples and guidelines for model construction.

Concentration on the three major parts of nonlinear programming is provided:

- Convex analysis with discussion of topological properties of convex sets, separation and support of convex sets, polyhedral sets, extreme points and extreme directions of polyhedral sets, and linear programming
- Optimality conditions and duality with coverage of the nature, interpretation, and value of the classical Fritz John (FJ) and the Karush-Kuhn-Tucker (KKT) optimality conditions; the interrelationships between various proposed constraint qualifications; and Lagrangian duality and saddle point optimality conditions
- Algorithms and their convergence, with a presentation of algorithms for solving both unconstrained and constrained nonlinear programming problems

Important features of the *Third Edition* include:

- New topics such as second interior point methods, nonconvex optimization, nondifferentiable optimization, and more
- Updated discussion and new applications in each chapter
- Detailed numerical examples and graphical illustrations
- Essential coverage of modeling and formulating nonlinear programs
- Simple numerical problems
- Advanced theoretical exercises

The book is a solid reference for professionals as well as a useful text for students in the fields of operations research, management science, industrial engineering, applied mathematics, and also in engineering disciplines that deal with analytical optimization techniques. The logical and self-contained format uniquely covers nonlinear programming techniques with a great depth of information and an abundance of valuable examples and illustrations that showcase the most current advances in nonlinear problems.

ABOUT THE AUTHOR

Mokhtar S. BAZARAA, PhD, is a Professor at the Georgia Institute of Technology.

HANIF D. SHERALI, PhD, is a W. Thomas Rice Chaired Professor of Engineering in the Grado Department of Industrial and Systems Engineering at Virginia Polytechnic Institute and State University.

C. M. SHETTY, PhD, is a Professor Emeritus at the Georgia Institute of Technology.

Professors Bazaraa and Sherali are also coauthors of the complementary bestselling book, *Linear Programming and Network Flows*, Third Edition, also published by Wiley.

NEW TO EDITION

- Is updated throughout with new content, including, but not limited to, discussions on second-order necessary conditions, variable target value methods, primal-dual path, and quadratic constraints, among others

- Includes over three new applications per chapter to showcase the currency of the content
-

FEATURES

- Covers, in-depth, a topic which is typically not given much attention
 - Incorporates timely footnotes and references throughout the text to keep the reader well-informed of changes in the marketplace
 - Has ample exercises which reinforce the theory and concepts presented in the text
 - Has been extensively class-tested, over a fifteen-year period, to avoid errata and annoying misconceptions about NLP techniques
-
