DESCRIPTION

The leading text in the field explains step by step how to write software that responds in real time

From power plants to medicine to avionics, the world increasingly depends on computer systems that can compute and respond to various excitations in real time. The Fourth Edition of Real-Time Systems Design and Analysis gives software designers the knowledge and the tools needed to create real-time software using a holistic, systems-based approach. The text covers computer architecture and organization, operating systems, software engineering, programming languages, and compiler theory, all from the perspective of real-time systems design.

The Fourth Edition of this renowned text brings it thoroughly up to date with the latest technological advances and applications. This fully updated edition includes coverage of the following concepts:

- Multidisciplinary design challenges
- Time-triggered architectures
- Architectural advancements
• Automatic code generation

• Peripheral interfacing

• Life-cycle processes

The final chapter of the text offers an expert perspective on the future of real-time systems and their applications.

The text is self-contained, enabling instructors and readers to focus on the material that is most important to their needs and interests. Suggestions for additional readings guide readers to more in-depth discussions on each individual topic. In addition, each chapter features exercises ranging from simple to challenging to help readers progressively build and fine-tune their ability to design their own real-time software programs.

Now fully up to date with the latest technological advances and applications in the field, Real-Time Systems Design and Analysis remains the top choice for students and software engineers who want to design better and faster real-time systems at minimum cost.

ABOUT THE AUTHOR

PHILLIP A. LAPLANTE, PhD, PE, is Professor of Software Engineering at Penn State, where he specializes in software and systems engineering, project management, and software testing and security. Dr. Laplante spent several years as a software engineer and project manager working on avionics, computer-aided design, and software test systems. He has authored or edited twenty-seven books and has published more than 200 scholarly articles.

SEppo J. ovaska, DSc, is Professor of Industrial Electronics at Aalto University, Finland. He has served as a visiting scholar at Utah State University, Virginia Tech, and the University of Passau, Germany, and has published more than 100 articles in peer-reviewed journals. Prior to his academic career, Dr. Ovaska developed control systems for high-rise elevators; those contributions led to nine international patents.
