Introduction To The Physics and Techniques of Remote Sensing, 2nd Edition
Charles Elachi, Jakob J. van Zyl

Hardcover ISBN: 978-0-471-47569-9  April 2006  $207.00

DESCRIPTION

The science and engineering of remote sensing--theory and applications

The Second Edition of this authoritative book offers readers the essential science and engineering foundation needed to understand remote sensing and apply it in real-world situations. Thoroughly updated to reflect the tremendous technological leaps made since the publication of the first edition, this book covers the gamut of knowledge and skills needed to work in this dynamic field, including:

* Physics involved in wave-matter interaction, the building blocks for interpreting data
* Techniques used to collect data
* Remote sensing applications

The authors have carefully structured and organized the book to introduce readers to the basics, and then move on to more advanced applications. Following an introduction, Chapter 2 sets forth the basic properties of electromagnetic waves and their interactions with matter. Chapters 3 through 7 cover the use of remote sensing in solid surface studies, including oceans. Each chapter covers one major part of the electromagnetic spectrum (e.g., visible/near infrared, thermal infrared, passive microwave, and active microwave).
Chapters 8 through 12 then cover remote sensing in the study of atmospheres and ionospheres. Each chapter first presents the basic interaction mechanism, followed by techniques to acquire, measure, and study the information, or waves, emanating from the medium under investigation. In most cases, a specific advanced sensor is used for illustration.

The book is generously illustrated with fifty percent new figures. Numerous illustrations are reproduced in a separate section of color plates. Examples of data acquired from spaceborne sensors are included throughout. Finally, a set of exercises, along with a solutions manual, is provided.

This book is based on an upper-level undergraduate and first-year graduate course taught by the authors at the California Institute of Technology. Because of the multidisciplinary nature of the field and its applications, it is appropriate for students in electrical engineering, applied physics, geology, planetary science, astronomy, and aeronautics. It is also recommended for any engineer or scientist interested in working in this exciting field.

▲ ABOUT THE AUTHOR

CHARLES ELACHI, PhD, is Director of NASA’s Jet Propulsion Laboratory and Vice President at the California Institute of Technology, where he is also Professor of Electrical Engineering and Planetary Science. Dr. Elachi is internationally recognized for his role in the development of a series of spaceborne imaging radars for Earth and planetary observations.

JAKOB van ZYL, PhD, is Director for Astronomy and Physics at the Jet Propulsion Laboratory, and a Lecturer in Electrical Engineering and Geological and Planetary Sciences, California Institute of Technology. Dr. van Zyl is internationally recognized for his role in the development of imaging polarimetric radars and the associated data analysis and interpretation.

■ FEATURES

• Extensive additions and updates to content.

• Replacement of nearly 50% of the figures.

• Incorporated set of exercises and solutions manual.
SERIES

Wiley Series in Remote Sensing and Image Processing
