DESCRIPTION

The volumes in this continuing series provide a compilation of current techniques and ideas in inorganic synthetic chemistry. Includes inorganic polymer syntheses and preparation of important inorganic solids, syntheses used in the development of pharmacologically active inorganic compounds, small-molecule coordination complexes, and related compounds. Also contains valuable information on transition organometallic compounds including species with metal-metal cluster molecules. All syntheses presented here have been tested.

ABOUT THE AUTHOR

Harry R. Allcock is an Evan Pugh Professor of Chemistry at Pennsylvania State University. He also has affiliations with the university's Departments of Chemical Engineering and Biomedical Engineering. He received the International Award of the Polymer Society of Japan and was elected to the National Academy of Engineering.
