DESCRIPTION

Published by the American Geophysical Union as part of the Water Science and Application Series, Volume 6.

During the past four decades, computer-based mathematical models of watershed hydrology have been widely used for a variety of applications including hydrologic forecasting, hydrologic design, and water resources management. These models are based on general mathematical descriptions of the watershed processes that transform natural forcing (e.g., rainfall over the landscape) into response (e.g., runoff in the rivers). The user of a watershed hydrology model must specify the model parameters before the model is able to properly simulate the watershed behavior.

ABOUT THE AUTHOR

Qingyun Duan and Hoshin V. Gupta are the authors of Calibration of Watershed Models, published by Wiley.
