Design and Analysis of Experiments, 9th Edition continues to help senior and graduate students in engineering, business, and statistics—as well as working practitioners—to design and analyze experiments for improving the quality, efficiency and performance of working systems.

This bestselling text maintains its comprehensive coverage by including: new examples, exercises, and problems (including in the areas of biochemistry and biotechnology); new topics and problems in the area of response surface; new topics in nested and split-plot design; and the residual maximum likelihood method is now emphasized throughout the book.

ABOUT THE AUTHOR

Douglas C. Montgomery, Regents' Professor of Industrial Engineering and Statistics at Arizona State University, received his B.S., M.S., and Ph.D. degrees from Virginia Polytechnic Institute, all in engineering. From 1969 to 1984, he was a faculty member of the School of Industrial & Systems Engineering at the Georgia Institute of Technology; from 1984 to 1988, he was at the University of Washington, where he held the John M. Fluke Distinguished chair of Manufacturing Engineering, was Professor of Mechanical Engineering, and Director of the Program in industrial Engineering. He has authored and coauthored many technical papers as well as twelve other books. Dr. Montgomery is a Stewart Medalist of the American Society for Quality, and has also received the Brumbaugh Award, the William G. Hunter Award, and the Shewell Award(twice) from the ASQ.
NEW TO EDITION

• 83 new homework problems (including in the areas of biochemistry and biotechnology).

• Additional examples of single-factor experiments, such as a study involving chocolate consumption and cardiovascular health (Chapter 3)

• New section on the random effects model (Chapter 3)

• New material on nonregular fractions as alternatives to traditional abberation fractions in 16 runs and analysis methods for those designs discussed and illustrated.

• New material on constructing factorial and fractional factorial designs using an optimal design tool (Chapter 9).

• New topics and problems in the area of response surface, including designs that combine screening and optimization and use optimal designs (Chapter 11).

• New topics in nested and split-plot design

FEATURES

• Includes software examples taken from the four most dominant programs in the field: Design-Expert, Minitab, JMP, and SAS.

• Focuses on the connection between the experiment and the model that the experimenter can develop from the results of the experiement.
• **Stresses the importance of experimental design as a tool for engineers and scientists** to use for product design and development as well as process development and improvement. The use of experiemental design in developing products that are robust to environmental factors and other sources of variability is illustrated. The use of experimental design early in the product cycle can subsatantly reduce development lead time and cost, leading to processes and products that perform better in the field and have higher reliability than those developed using other approaches.
