The Pigmentary System: Physiology and Pathophysiology, 2nd Edition
James J. Nordlund (Editor), Raymond E. Boissy (Editor), Vincent J. Hearing (Editor), Richard A. King (Editor), William S. Oetting (Editor), Jean-Paul Ortonne (Editor)

DESCRIPTION

The most comprehensive and integrated book on pigmentation

The Pigmentary System, Second Edition, gathers into one convenient, all-inclusive volume a wealth of information about the science of pigmentation and all the common and rare clinical disorders that affect skin color. The two parts, physiology (science) and pathophysiology (clinical disorders), are complementary and annotated so that those reading one part can easily refer to relevant sections in the other. For the clinician interested in common or rare pigment disorders or the principles of teaching about such disorders, this book provides an immediate and complete resource on the biologic bases for these disorders. For the scientist studying the biology of melanocyte function, the book provides a list of disorders that are related to basic biological functions of melanocytes.

New features of this Second Edition include:

• Completely new section on the basic science of pigmentation – explaining the integration of melanocyte functions with other epidermal cells and with various organ systems like the immune system

• New chapters on pigmentary disorders related to intestinal diseases, the malignant melanocyte, benign proliferations of melanocytes (nevi) and phototherapy with narrow band UV

• All clinical chapters include the latest genetic findings and advances in therapy

• More than 400 color images of virtually all clinical disorders
The book is ideal for all dermatologists and especially those interested in disorders of pigmentation. It is of particular use for pediatric dermatologists and medical geneticists caring for patients with congenital and genetic pigmentary disorders. This authoritative volume will fill the gap for dermatology training programs that do not have local experts on pigmentation. Basic and cosmetic scientists studying pigmentation and melanocytes will find the science and clinical correlations very useful in showing human significance and relevance to the results of their studies.

ABOUT THE AUTHOR

FEATURES

The most comprehensive and integrated book on pigmentation

• Completely new section on the basic science of pigmentation – explaining the integration of melanocyte functions with other epidermal cells and with various organ systems like the immune system
