DESCRIPTION

The only up-to-date book on this important technology, *Extrusion Processing Technology: Food and Non-Food Biomaterials* bridges the gap between the principles of extrusion science and the practical "know how" of operational engineers and technicians. Written by internationally renowned experts with over forty years of experience between them, this valuable reference for food scientists, food engineers, chemical engineers, and students includes coverage of new, greener technologies as well as case studies to illustrate the practical, real-world application of the principles in various settings.

ABOUT THE AUTHOR

**Professor Jean-Marie Bouvier, Vice President (Technology Development), Clextral, Lyon, France**

Professor Bouvier has taught and researched food and chemical engineering at the Technology University of Compiègne (France) and at Amherst University, Massachusetts (USA). At Compiègne he managed a research team which studied food texturisation processes and related technologies, in close partnership with the food industry. The research team led an important research program in extrusion processing technology. In 1995 he joined Clextral, a manufacturer of twin-screw extrusion technology, and is now Vice-President in charge of scientific and technological development. Professor Bouvier has published more than 100 scientific papers in international periodicals, as well as five chapters in books dealing with extrusion processing and technology.
Professor Osvaldo H. Campanella, Agriculture and Biological Engineering, Whistler Carbohydrate Research Center, Purdue University, Indiana, USA

Since graduating from the University of Buenos Aires, Professor Campanella has lectured in food engineering at the University of Massachusetts, Massey University (New Zealand) and Purdue University (USA). He has specialized in food extrusion, the rheology of complex fluids, and food and biological engineering, and his research is currently focused on extrusion, rheology, heat transfer modeling, and modeling of cereal processes. He is also actively involved in research related to new methods to characterize the formation of complex compounds using novel acoustic/ultrasound techniques though porous media. Professor Campanella has published close to 100 scientific articles, has acted as associate editor of a number of specialized journals and has contributed chapters to a number of books.
