The book series "Polymer Nano-, Micro- and Macrocomposites" provides complete and comprehensive information on all important aspects of polymer composite research and development, including, but not limited to, synthesis, filler modification, modeling, characterization as well as application and commercialization issues. Each book focuses on a particular topic and gives a balanced in-depth overview of the respective subfield of polymer composite science and its relation to industrial applications. With the books the readers obtain dedicated resources with information relevant to their research, thereby helping to save time and money.

In this first volume in the series, authors from leading academic institutions and companies share their first-hand knowledge of nanotube-surface enhancements for use in polymer composites. All the important methods for the functionalization of nanotube fillers, including polymer wrapping, non-covalent modification with nanoparticles, silica layers or entrapped micelles, chemically induced growth of multilayers, techniques based on covalent bonding, such as polymer or quantum dot attachment, and direct polymerization approaches are covered.

ABOUT THE AUTHOR

Vikas Mittal is Polymer Engineer at BASF Polymer Research in Ludwigshafen, Germany. He obtained his PhD in 2006 in Polymer and Materials Engineering from the Swiss Federal Institute of Technology in Zurich, Switzerland. Later, he worked as a Materials Scientist in the Active and Intelligent Coatings section of SunChemical in London, UK. His research interests include polymer
nanocomposites, novel filler surface modifications, thermal stability enhancements, polymer latexes with functionalized surfaces etc. He has authored over 40 scientific publications, book chapters and patents on these subjects.
